Architectural Acoustics

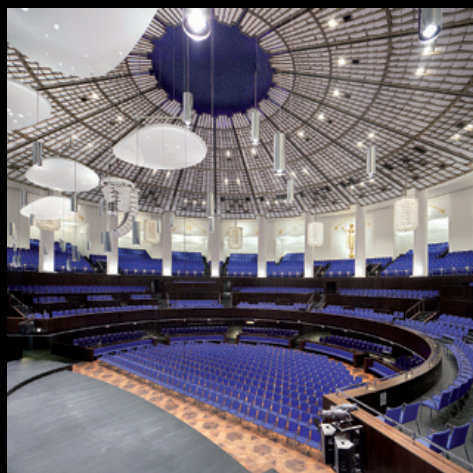

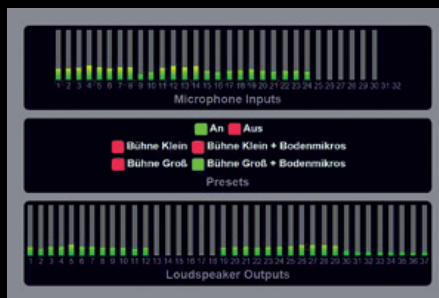

Architectural Acoustics. Tradition Redefined.

**Leaving limitations behind opens up a horizon of new opportunities.
Optimizing the acoustical parameters of a venue creates perfect rooms
for a multitude of different and challenging stage productions.**

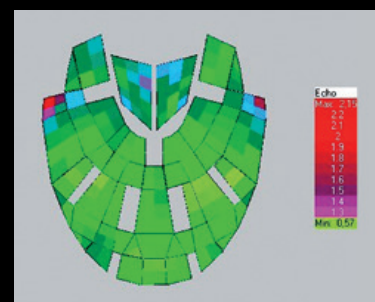

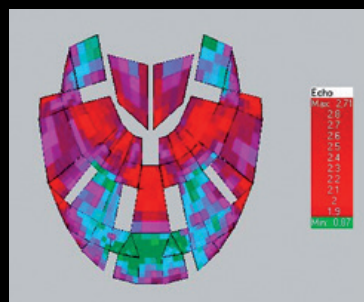

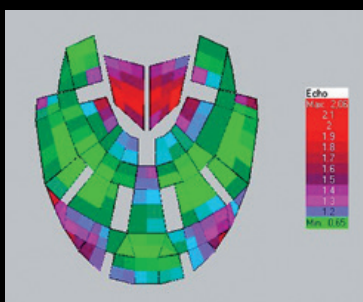

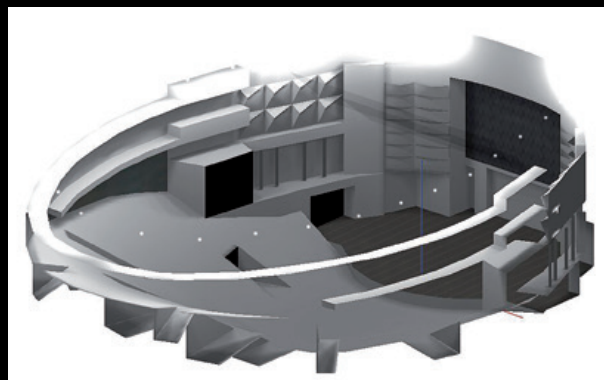

Create new capabilities:

**Opera, concert, theater, presentations, ensemble – Amadeus guarantees
the perfect acoustical context. No compromises. At the push of a button.**

The Concept.

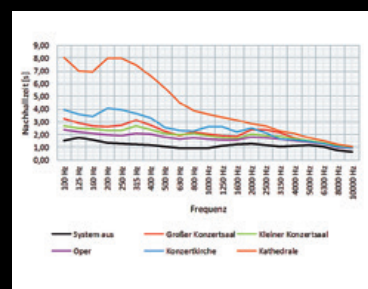

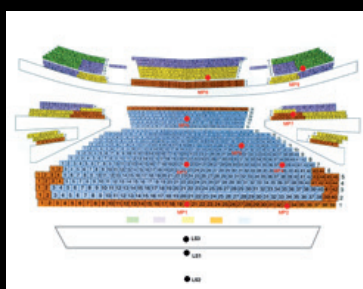

Architectural acoustics are being built on the integration of the existing room. Nearly invisible microphones over stage and auditorium record orchestra, artist, actor, presenter and the response of the room. The Amadeus peak performance processor builds the required responses to achieve optimal and natural acoustical results.

All important acoustical parameters, diffuse sound and early reflections will be improved.

Artists and audience become part of an ideal touching room for unforgettable moments.

Your Benefits.

Architectural acoustics allow for dramatically reduced reconstructions. It offers additional application possibilities of concert halls, drama theaters as well as presentation and conference rooms.

Switch your applications. Design your potentials. Extend the range of possibilities of your venue. Increase its profitability.
